

Advancing Academic Integrity: SafeAssign for Blackboard Learn

Provide instructors with integrated anti-plagiarism capabilities within Blackboard Learn, including detailed and actionable reporting for reviewing assessment submissions.

Part of the family

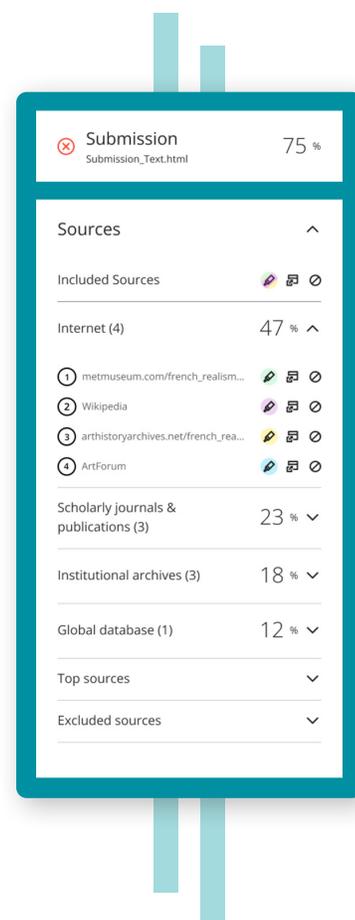

SafeAssign offers the best available anti-plagiarism integration with Blackboard® Learn, with all core functionality embedded natively into assessment workflows. Support is available via the same Anthology channels you're already familiar with, and best of all, there are no additional costs or implementations.

A 360° approach to detecting plagiarism

Every one of the 65 million+ documents reviewed in SafeAssign each year is tested for similarity against a broad range of sources, including the internet, ProQuest database, institutional sources, and SafeAssign's Global Academic Database. Instructors can also add their own sources to ensure key texts related to their subject area aren't being used inappropriately in student submissions.

Reporting that provides both general and granular views

Originality Reports in SafeAssign inform instructors of the probability that work has been plagiarized. Instructors can also access more detailed information, such as the potential source work has been taken from and where it occurred in the text, allowing them to thoroughly review the submission. These reports can be downloaded at any time for use outside of the LMS environment.
